Multilevel and Longitudinal Modeling Using Stata, Third Edition, by Sophia Rabe-Hesketh and Anders Skrondal, looks specifically at Stata's treatment of generalized linear mixed models, also known as multilevel or hierarchical models. These models are "mixed" because they allow fixed and random effects, and they are "generalized" because they are appropriate for continuous Gaussian responses as well as binary, count, and other types of limited dependent variables.

Multilevel modeling offers a unique framework for analyzing longitudinal data because. It tolerates missing waves of data; It tolerates differently spaced waves of data from different subjects; It accounts for correlations of observations across time; It allows you to study changes over time, such as changes in elevation and slope.

In today's post, I'd like to show you how to use multilevel modeling techniques to analyse longitudinal data with Stata's xtmixed command. Last time, we noticed that our data had two features. First, we noticed that the means within each level of the hierarchy were different from each other and we incorporated that into our data analysis by fitting a "variance component" model using Stata's xtmixed command.
