Shut the Fuck Up and Calculate (Or Not): "The Nature of Space and Time" by Stephen Hawking and Roger Penrose "I have emphasized what I consider the two most remarkable features that I have learned in my research on space and time: (1) that gravity curls up space-time so that it has a beginning and an end; (2) that there is a deep connection between gravity and thermodynamics that arises because gravity itself determines the topology of

Scientists Are Rethinking the Very Nature of Space and Time

Absolute space, in its own nature, without relation to anything external, remains always similar and immovable. Absolute, true, and mathematical time, is itself, and from its own nature, flows equably without relation to anything external. This concept of time seems natural enough. We all accept it almost unthinkingly.

Philosophy of space and time is the branch of philosophy concerned with the issues surrounding the ontology, epistemology, and character of space and time. While such ideas have been central to philosophy from its inception, the philosophy of space and time was both an inspiration for and a central aspect of early analytic philosophy. The subject focuses on a number of basic issues, including whether time and space exist independently of the mind, whether they exist independently of one ...

Since 2000 a new approach to the issue of the nature of space-time structures has emerged, in the works of Robert Disalle, and especially Oliver Pooley and Harvey Brown. The latter's 'dynamical approach' asserts that the space-time structure of our world is what it is because of the dynamical laws of nature and their symmetries. That is, the dynamical laws are (at least, relative to space-time) fundamental, and space-time structure is derivative.
